

## Release Notes v7.0.2.25

Release Date: January 2025

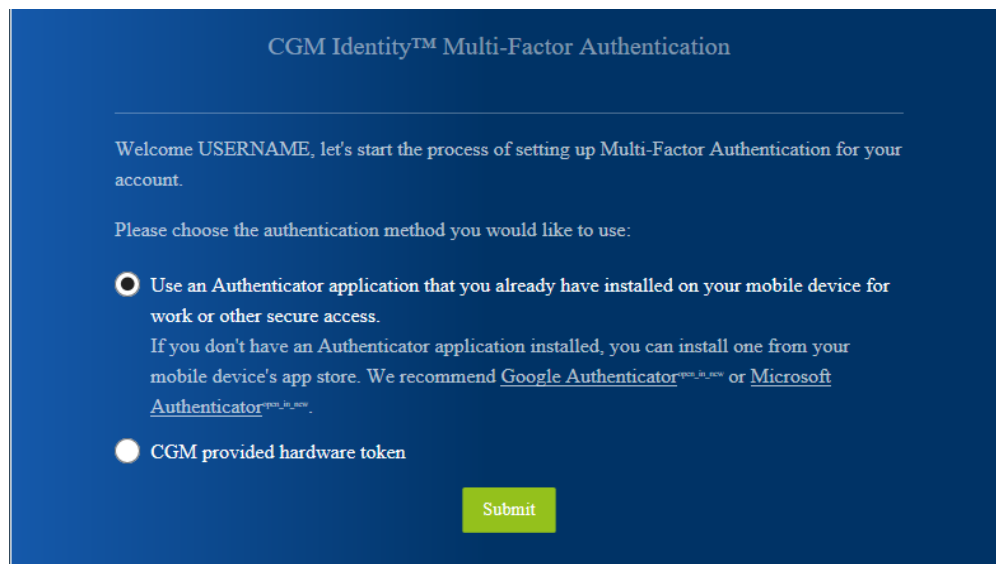

### Encounters (*Encounters > Encounter Management*)

Resolved an issue where a duplicate diagnosis code error was only displaying when a duplicate was entered in **Diag Codes** 1 through 4. When a duplicate diagnosis code is entered in 1 - 12, a *Rule Failure* error is now displayed. When this occurs, the *Encounter Status* will show Failed Rules.

### Multi-Factor Authentication

An issue that was caused by expired MFA tokens has been resolved.

An enhancement has been made to allow users to access multiple schemas without being prompted for MFA each time. This change will prompt each user to setup up a new MFA account regardless of whether they access multiple schemas or not. When prompted for a name, be sure to use a different name than the existing MFA account.

The QR code that was previously distorted has been corrected.

### CGM Identity™ Multi-Factor Authentication

## Authenticator Application Setup

Using your authenticator app, scan the QR Code or enter this key:

`o6nk lpen ej6m stva vqwh dchl oake ycx5`

Spaces and casing do not matter.

Once you have scanned the QR code or input the key above, select **CGM DAQBilling - Example** to get a unique 6-digit security code. Enter the code in the field below.

☐ Trust this device for 1 week

Input the 6-digit security code:
